

INTERNSHIP ASSESSMENT TASKS

Domain-wise Practical Assessment Guidelines for Internship Applicants

🕒 **Submission Deadline: Saturday (8th August 2026)**

General Instructions

- Attempt only the task for the domain you have applied for.
- Every task below is scoped to be realistically completed within 48 hours — stick to the stated scope rather than over-building.
- Use the dataset, website, or API links provided for each track wherever applicable; use free/open-source tools and free-tier services throughout.
- Push all code to a public GitHub repository with a clear README explaining setup and usage.
- Submit one PDF report containing: Project Description, Screenshots of Code/Charts/Output, Key Insights & Recommendations, and the GitHub Repository Link.
- Submit your completed assessment using this form:
https://docs.google.com/forms/d/e/1FAIpQLSfsQC8HAYdxylv4ap6iA-61KzFovN5dsJF_nJVXSAPDXp7pJQ/viewform?usp=header

AI/ML

🕒 **Submission Deadline: Saturday (8th August 2026)**

ASSESSMENT TASK

Build a spam-detection model that classifies SMS messages as 'spam' or 'ham' (not spam), and wrap it in a simple web demo where a user can type a message and get an instant prediction.

REQUIREMENTS

- Load and clean the SMS Spam Collection dataset (remove noise, lowercase, tokenize)
- Convert text to numerical features using TF-IDF (or CountVectorizer)
- Train and compare 2 models (e.g., Naive Bayes and Logistic Regression)
- Evaluate both models using accuracy, precision, recall, and a confusion matrix; pick the better one
- Build a simple Streamlit (or Flask) app where a user types a message and sees the spam/ham prediction
- Note the model's limitations (e.g., short messages, sarcasm, unseen slang) and how it could be improved

TECHNOLOGIES / TOOLS

Python, Scikit-learn, Pandas, NumPy, Streamlit or Flask, Jupyter Notebook, Git/GitHub

SUBMISSION

Submit one consolidated PDF report containing all of the following:

- Project Description — a short write-up of what you built and how you approached it
- Screenshots of Code, Charts & Output — clear screenshots showing your working code, key results/visualizations, and the final output/app in action
- Key Insights & Recommendations — what you learned, any challenges faced, and suggestions for improvement
- GitHub Repository Link — public repo with all source code and a README with setup instructions
